Methods and definitions

The **index of the volume of retail trade** measures the evolution of the turnover in retail trade, adjusted for price changes (deflated), i.e. the evolution of the total amount of goods sold, based on data adjusted for calendar and seasonal effects.

Seasonally adjusted euro area and EU series are calculated by aggregating the seasonally adjusted national data. Eurostat carries out the seasonal adjustment of the data for those countries that do not adjust their data for seasonal effects.

Missing observations from Member States for recent months are estimated for the calculation of the euro area and the EU aggregates.

Revisions and timetable

Data of previous months have been revised compared to those issued in the News Release [105/2017](#) of 5 July 2017. The monthly percentage change for May 2017 remains unchanged at +0.4% in the euro area and has been revised from +0.2% to +0.3% in the EU28. The annual percentage change has been revised from +2.6% to +2.4% in the euro area and remains unchanged at +2.6% in the EU28.
